

ELECTROFORMING

ITALIAN JEWELRY TECHNIQUE
IN ACCESSORIES

The electroforming technique is an innovative way to create unique, high-quality accessories!

RUBBER

1.

In this process, a design is developed in rubber, and a conductive mold is created in solid low-fusion material as a base.

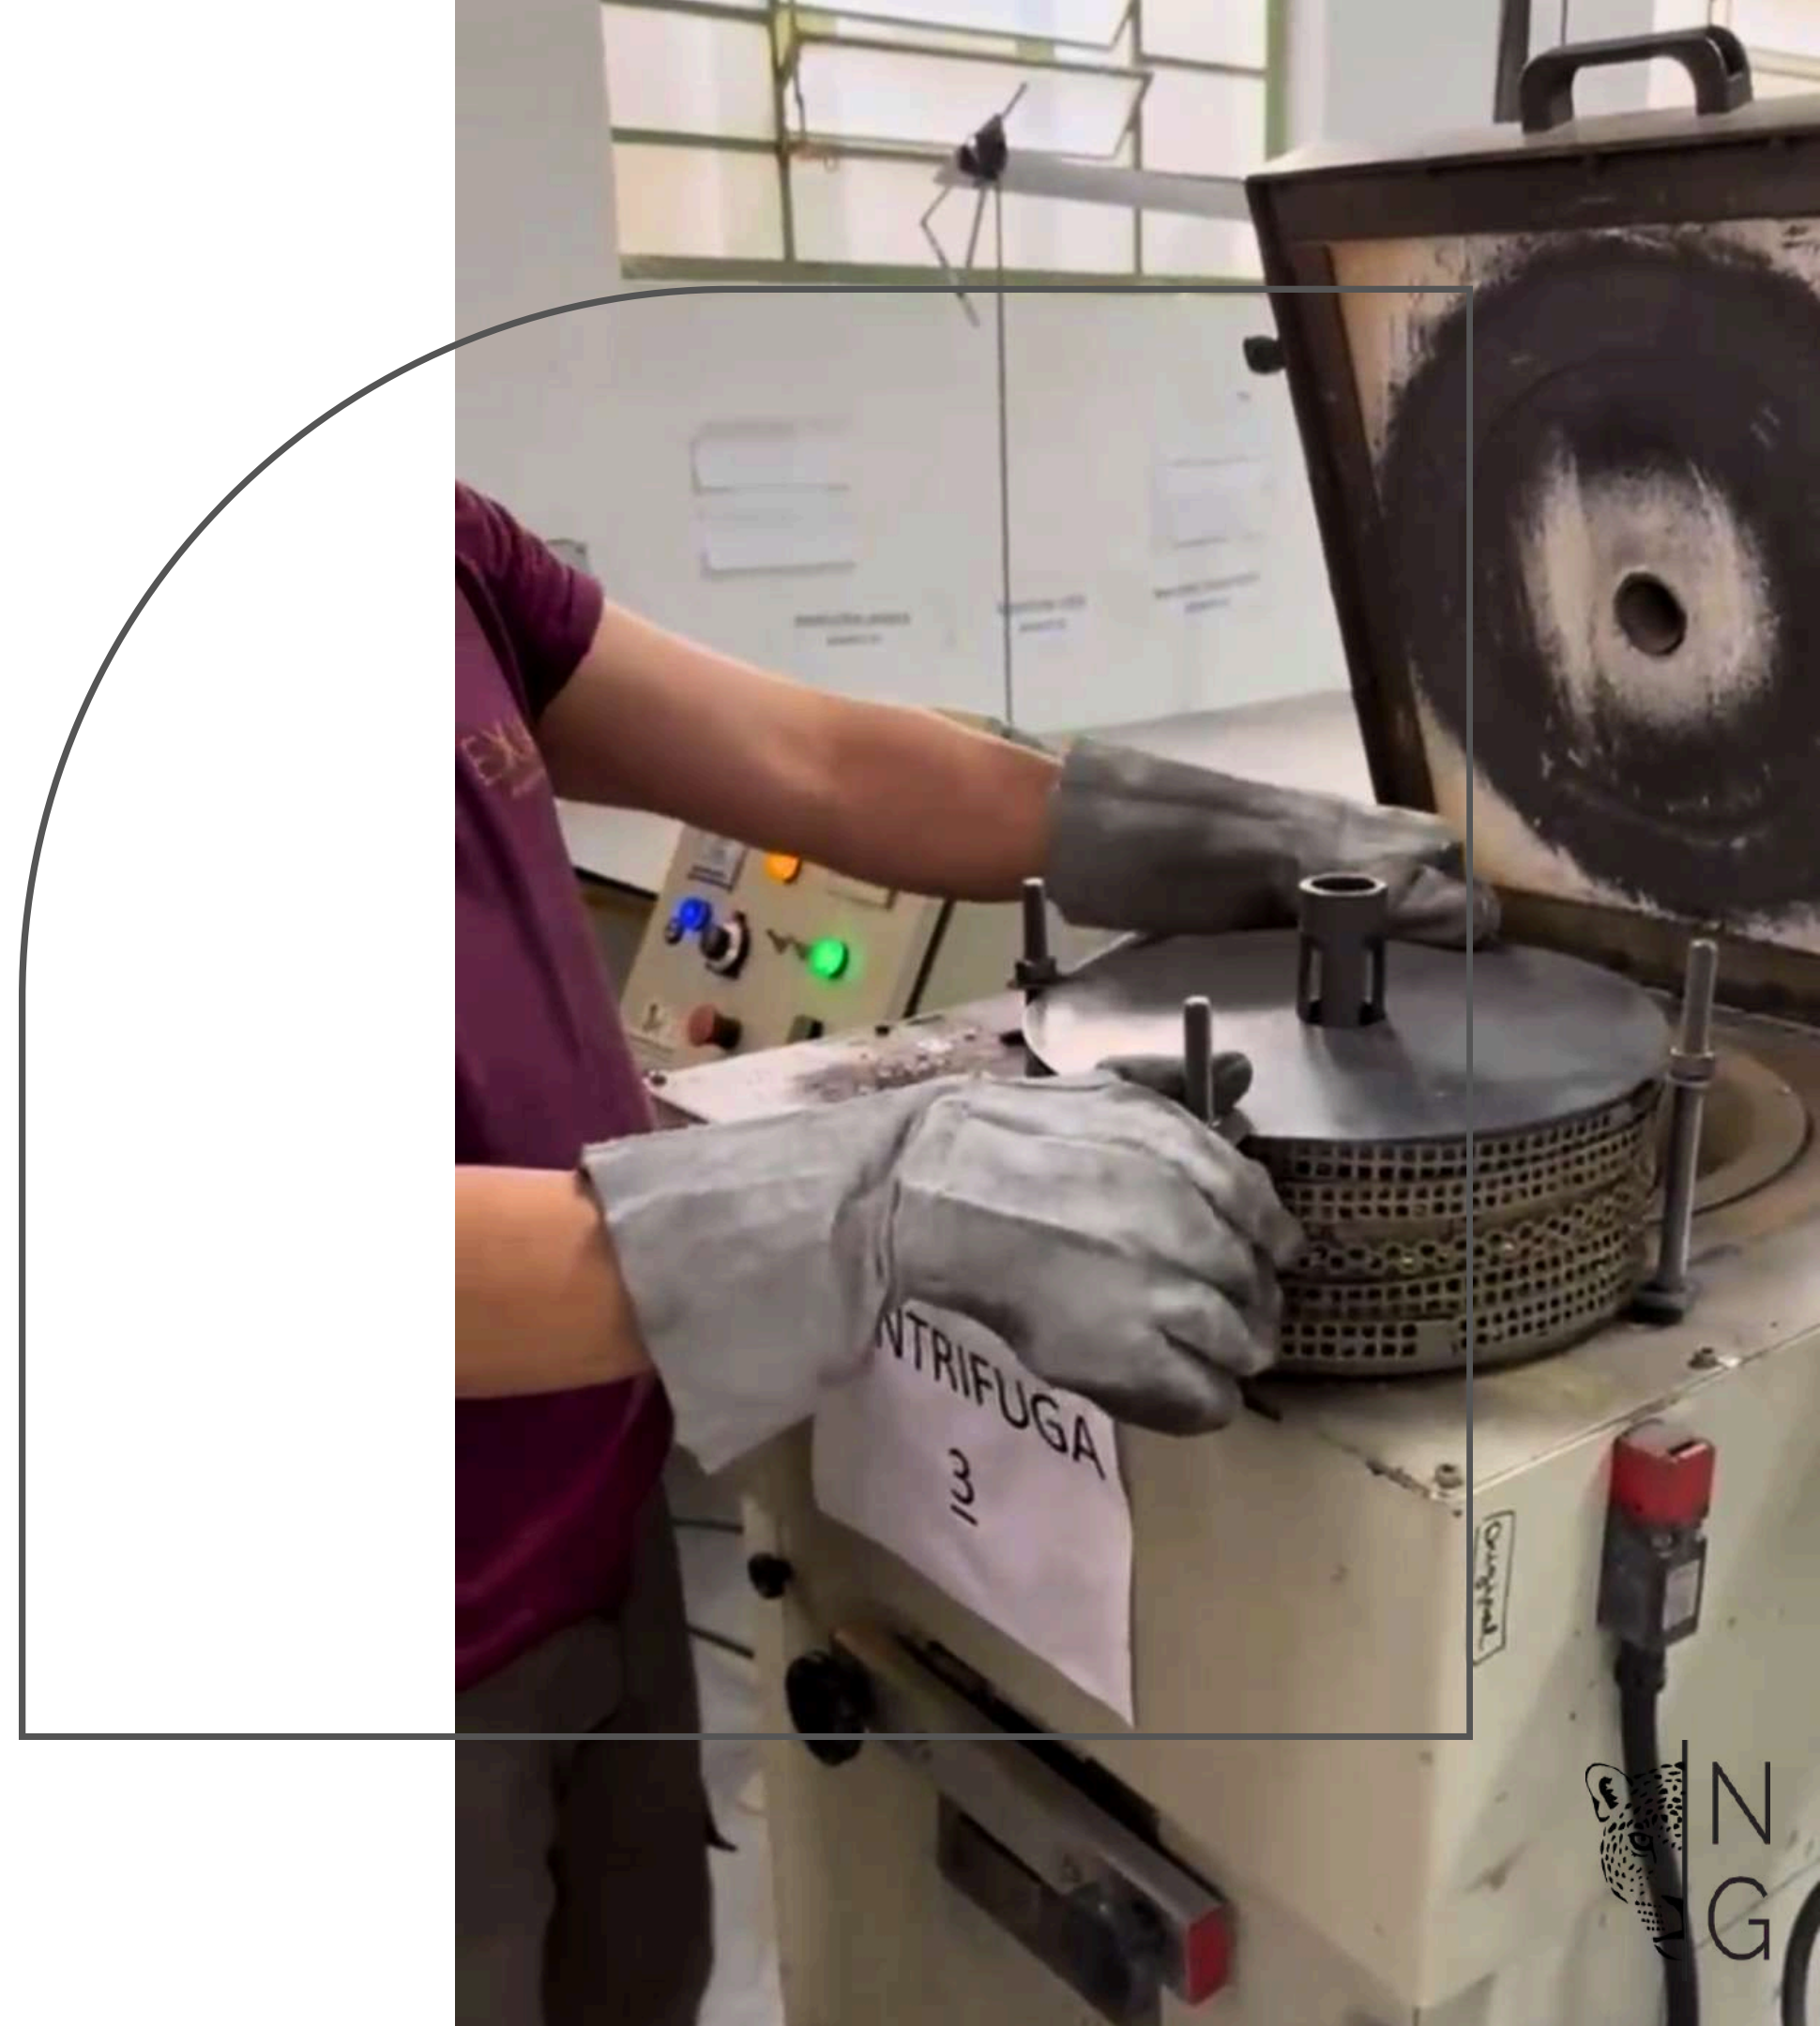

2.

Next, a thin layer of copper is deposited in the conductive mold through electrolysis.

3.

After this process, the material inside melts, resulting in light and durable pieces.

It is important to highlight that all pieces need holes to be finished at strategic points to improve the aesthetics and durability of the pieces!

The pieces are also polished for a shiny finish and the desired finish in shades of gold, silver, graphite.

This technique allows us to create exclusive, sophisticated and statement designs, providing an elegant and modern appearance to our accessories!
