Evaluation of the cybersecurity program

At YottaSec we help organizations improve their business performance while transforming their perception and their risk management through our program evaluation and compliance services. As companies increasingly rely on automation and IT, data protection and system availability are essential.

Having confidence in your information security program can have a positive impact on improving productivity, availability, integrity, and insurance. Capacity maturity measurement of an organization security program with experienced partners as we will make you benefit from significant gains in information security performance and your risk management capabilities.

Incident response

Businesses are more than ever facing the ever-increasing threats from malicious actors. As the saying goes, “There are only two types of organizations: those that know that they’ve been hacked and those that don’t yet know” Nowadays, the question is not whether your company is a target – but simply when this threat will materialize. Organizations, especially SMBs, are not prepared to protect their information systems.

YottaSec can assist you to prevent your data from falling into the hands of cybercriminals or ransomware. We have a certified and qualified team that can provide a quick response and reduce wait time for the resumption of your operations. We offer incident response options and packages to help with your recovery efforts.

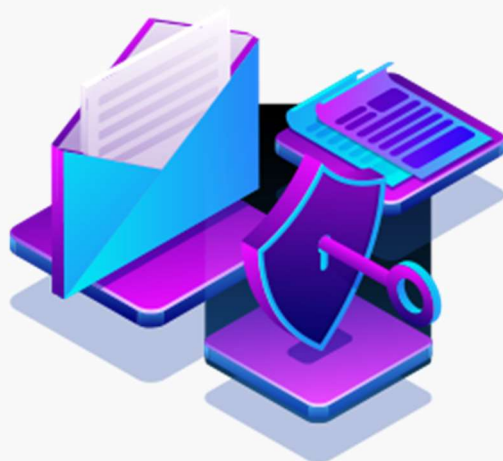

Security Awareness

Active user training helps Stop Active Phishing Attacks. Knowledgeable users are key to identifying — and stopping — phishing attacks that slip through perimeter technology. Employees play a vital role in reducing organizational risk with respect to cyberattacks. We work with leading solution providers in the development of cybersecurity training and training modules.

Through cybersecurity awareness training, users are brought up to speed on an organization's IT security procedures, policies and best practices. These education modules not only help to ensure staff is aware of these principles but that they also follow and understand them. Arm your end users with the tools allowing them to be part of the security solution and not the risk.

Training topics cover current issues such as: Clean Desktop Policy, Bring-Your-Own-Device (BYOD) Strategies, Data Classification, Removable Media, Social Engineering, Secure Habits to Adopt on the Internet, etc.

Penetration Testing

Our team can give you a clear idea of the performance of your security checks and your integrated defense systems. We perform an appropriate security assessment to identify exploitable vulnerabilities in the security posture of your system. By performing regular intrusion testing and security scans on the overall environment, which in turn will provide a way to detect and resolve security problems by ranking the vulnerabilities before someone or something can exploit them. For example, these tests include:

- Examination of the effectiveness of the attack surface
- Security Evaluation of Cloud Services
- Threat Assessment Following a Merger or Acquisition
- Mobile app security assessment
- Hardware Device Security Assessment
- Assessment of the security of the Internet of Things
- Security Review of the Network Architecture
- Assessing Threats and Risks Related to Physical Security

SOCAAS - SOC as-a-service

YottaSec offers fully managed monitoring and detection services 24/7, 365 days a year for organizations seeking to proactively defend against attacks. We have a unique approach in that we actively describe how attackers work throughout the life cycle of an attack to identify virtually every aspect of a hack.

Our team of security analysts and experts detect and analyze advanced attack models and alert customers of these malicious threats in minutes. Our highly qualified analysts can work with your existing team. Our approach is to understand your environment, determine what is most important to you, and establish custom escalation procedures to facilitate effective response and communication

FOR YOUR INFOSEC NEEDS
